Your first agent-generated document

A working local demo

This PDF was created by sending Markdown to the running document API. The server formatted the content, rendered it with Chromium, stored the PDF, and returned a private download capability.

What an agent sends

An agent supplies a **title**, **Markdown content**, and an **idempotency key**. It can use either the REST API or the MCP tool.

Step	What happens	Result
1	Validate the request	Accepted
2	Format and render the document	PDF
3	Store the artifact privately	24-hour lifetime
4	Download with the returned capability	Authorized

Why repeated requests are safe

Retrying the same request with the same idempotency key returns the existing job. It does not generate a second PDF or settle a second payment.

Local mode

This demonstration uses the explicit local payment bypass. **No cryptocurrency payment is made.** A deployed service must use the configured x402 facilitator to verify payment before rendering and settle after storing the output.

International text

Příliš žluťoučký kůň. Français: qualité et résultat. Deutsch: Größe und Zuverlässigkeit.

> The document you are reading came from the live local API, rather than the sample bundled with the project.
